Outpost24
Vulnerability Management Made Easy

Since 2001, Outpost24 has been a leader in vulnerability management solutions, developing state of the art vulnerability management technology from the core, up. Today, Outpost24 solutions are used by over 2000 corporate and government clients in over 40 countries to proactively protect their internal and external networks.

Outpost24 operates in all business verticals, ranging from services organizations, government, heavy industry, finance, insurance and IT outsourcing. Outpost24 envisions vulnerability management made easy, and maintains this focus in all areas of development.

OUTSCAN

OUTSCAN is a turnkey software as a service (SaaS) perfect for organizations that need to perform external vulnerability scanning of their perimeter assets. The solution includes all Outpost24 features regarding vulnerability checks, automation and integration.

Clients are able to begin their first vulnerability scans within minutes of registering for a license. OUTSCAN also integrates seamlessly with other solutions such as the Web Application Scanner and HIAB.

HIAB

HIAB is an appliance-based vulnerability management solution. It comes in many forms including rack-mounted servers, small form factor appliances and virtualized appliances, supporting all main platforms of virtualization. HIAB is extremely scalable and several scanners can be grouped to efficiently cover networks of any size and distribution.

WAS

The Web Application Scanner (WAS) is Outpost24's module for detection of vulnerabilities in custom developed code. The scanner can be fully integrated with OUTSCAN and HIAB vulnerability scans or used as a stand-alone component.

The WAS scanner is capable of identifying earlier unknown web application vulnerabilities by performing extensive testing of the application. The WAS supports many forms of attacks, including but not limited to, SQL injection, Cross-site scripting and file inclusion attacks.

PCI

Outpost24 is an Approved Scanning Vendor (ASV) for PCI. Our turnkey PCI scanning solution is delivered in a SaaS format. All the work with PCI compliance can be managed from the tool including handling disputations and generating PCI certificates for submission.
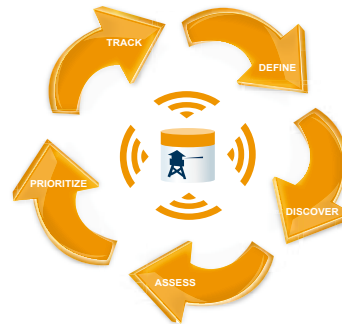

Expert Services

Outpost24 has years of experience with vulnerability management. Our technology experts provide various services from implementation and deployment to operational processes.

Implementation Services – Outpost24 helps you get up and running immediately by performing the first steps of defining, designing and configuring the technical solution to suit your organizations requirements.

Managed Services – Outpost24 allows you to quickly and easily adopt a vulnerability management program with constant support of vulnerability management experts so you can focus on your core business. Utilizing managed services ensures best practices are implemented from the beginning.

Penetration testing – Outpost24 has experts holding OSSTMM, CEH and CISSP certifications, with years of experience in methodically testing, evaluating and documenting each possible point of attack against your networks or applications.

Security Assessments – Outpost24 offers highly automated security assessments for clients looking for a third-party evaluation of their current security level.

Vulnerability Management Focused – Since our beginning in 2001, we have been focused on vulnerability management. As a result, our tools are focused at meeting those needs and maintaining the security of our clients.

Customer Driven Development – Our customers' feedback has led to our best improvements. Our tools and solutions are driven by our customers' needs and actual business requirements, rather than assumptions of developers and analysts.

Extensive Automation – When looking to minimize costs, automation is the best solution. Our tools are highly automated within areas based on best practices and will save you a significant amount of work and time.

Scanning-less Scanning (SLS) – Our tools provide up-to-date vulnerability information without the hassle of network loads, geographical distribution, service windows and availability requirements. This means you can test for vulnerabilities without performing a full scan of an entire asset base each time, but used previously learned intelligence as a basis.

Solution-Based Reporting – Where most in the business see problems, we see solutions. Our tools will help you isolate simple tasks to address multiple vulnerabilities resulting in minimal work and a higher ROI.

Management Overview – We offer reporting and overviews that communicate the progress of your vulnerability management in a way that doesn't require in-depth technical information or knowledge. This allows management to easily track and report on progress of your threat exposure.

High-Accuracy Scanning – Our scanning tools are continually improved and updated to be the most accurate scanners on the market. These improvements are not only driven by internal quality assurance but also by feedback from over 2000 organizations' reporting.

Unlimited Scalability – Outpost24 tools are fit for networks of all sizes. Our HIABs can be clustered in groups to support even the largest of networks. It is even possible to mix different appliances to increase scalability and span vast networks.

Virtualization Support – Outpost24 was the first in the market to release a virtual appliance for vulnerability management, and today we support all major virtualization platforms. This makes deployment, distribution and management of HIABs faster and easier in a modern infrastructure.
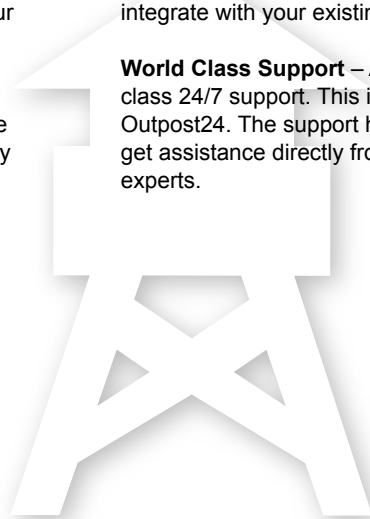

Customizable Reporting – Our integrated reporting functionality allows for highly customizable reporting with adjustable settings which can be reused for automated distribution. This saves time and provides accurate data to the right person at the right time.

Minimal Network Impact – Our scanner is configured to have minimal network impact and the system supports extensive load balancing and traffic limitations.

Server-Based Scanning – We use server-based vulnerability scanning at the core of our vulnerability management cycle. This means no software is installed on your investigated systems and that the solution can be entirely centrally managed. This also gives a far wider platform and device support.

Flexible Integration – HIAB supports SYSLOG, SNMP and SMTP allowing easy integration with ticketing and monitoring systems. Additionally, LDAP can be used to integrate with your existing user management systems.

World Class Support – All clients have access to our first class 24/7 support. This is included with any product from Outpost24. The support has no first line, our clients always get assistance directly from our experienced product experts.
